# Grammar Efficiency and the One-Meaning-One-Form Principle 

Relja Vulanović

Department of Mathematical Sciences
Kent State University at Stark
North Canton, Ohio, USA

QUALICO 2018

## Overview

- A measure of how much Anttila's (1972) OneMeaning - One-Form Principle (the Principle) is violated has been proposed in (Vulanović \& Ruff, QUALICO 2016).
- The measure is now incorporated in a new formula for calculating grammar efficiency.
- This is exemplified by parts-of-speech (PoS) systems in the sense of (Hengeveld, 1992).

## Contents

- Measures of the degree of violation of the Principle
- Hengeveld's PoS systems
- The old grammar-efficiency formula
- The new grammar-efficiency formula
- Results
- Conclusions

## Notation

- $|A|$ is the number of elements of a finite nonempty set $A$.
- $X=$ set of meanings, $Y=$ set of forms
- Set of pairs (relation): $\Phi \subseteq X \times Y$
- $B=$ set of one-to-one pairs:

$$
\begin{aligned}
& B=\{(x, y) \in \Phi: \xi(y)=v(x)=1\} \\
& \xi(y)=|\{x \in X:(x, y) \in \Phi\}|, y \in Y \\
& v(x)=|\{y \in Y:(x, y) \in \Phi\}|, x \in X
\end{aligned}
$$

## Basic Facts

- $|B| \leq|\Phi|$
- If $\Phi$ is a bijection (a one-to-one correspondence) between $X$ and $Y$, then $|X|=|Y|=|\Phi|=|B|$.

## The Measure $\mu(\Phi)$

1

1. $\mu(\Phi)=1$ if $\Phi$ is a bijection; otherwise $\mu(\Phi)>1$
2. $\mu(\Phi)$ is greater if $|\Phi|$ is greater and if $|X|$ and $|Y|$ are smaller
3. $\mu(\Phi)$ is smaller if $|B|$ is greater
4. $\mu(\Phi)=\mu\left(\Phi^{-1}\right), \Phi^{-1}=\{(y, x):(x, y) \in \Phi\}$

## The Measure $\mu(\Phi)$

2

- QUALICO 2016

$$
\mu(\Phi)=\mu_{\theta}(\Phi):=\frac{(1+\theta)|\Phi|-\theta|B|}{\min \{|X|,|Y|\}}, \theta>0
$$

- A simplified formula considered here:

$$
\mu(\Phi)=\frac{|\Phi|-|B|}{\min \{|X|,|Y|\}}+1 \geq 1
$$

- Properties 1-4 satisfied.

## The Weighted Formula

$$
\mu(\Phi)=\frac{\|\Phi\|-\|B\|}{\min \{\|X\|,\|Y\|\}}+1
$$

- $\|A\|=w_{1}+w_{2}+\cdots+w_{n},|A|=n$

$$
w_{i}=w_{i}(A), \quad \min w_{i}=1
$$

- If $w_{1}=w_{2}=\cdots=w_{n}=1$, then $\|A\|=|A|$ and v.v.

## PoS Systems: Propositional Functions

- $X=$ set of propositional functions (syntactic slots):
$\mathrm{P}=$ head of predicate phrase $R=$ head of referential phrase $r=o p t i o n a l ~ m o d i f i e r ~ o f ~ r e f e r e n t i a l ~ p h r a s e ~$ $p=o p t i o n a l ~ m o d i f i e r ~ o f ~ p r e d i c a t e ~ p h r a s e ~$
- $|X|=l=$ number of propositional functions in a PoS system, $1 \leq l \leq 4$.

## $Y=$ set of word classes, $|Y|=k$

| Word class | P | R | r | p |
| :--- | :---: | :---: | :---: | :---: |
| Verbs | V | - | - | - |
| Nouns | - | N | - | - |
| Adjectives | - | - | a | - |
| Manner adverbs | - | - | - | m |
| Heads | H | H | - | - |
| Predicatives | F | - | - | F |
| Nominals | - | \# | \# | - |
| Modifiers | - | - | M | M |
| * | $\mathrm{X}_{1}$ | - | $\mathrm{X}_{1}$ | - |
| * | - | $\mathrm{X}_{2}$ | - | $\mathrm{X}_{2}$ |
| Non-verbs | - | ^ | ^ | ^ |
| *Non-nouns | Z | - | Z | Z |
| * | $\mathrm{X}_{3}$ | $\mathrm{X}_{3}$ | $\mathrm{X}_{3}$ | - |
| * | $\mathrm{X}_{4}$ | $\mathrm{X}_{4}$ | - | $\mathrm{X}_{4}$ |
| Contentives | C | C | C | C |

## Weights

## 1

- Weight of $\mathrm{P}=\alpha$

| $\boldsymbol{l}$ | Propositional functions <br> in the PoS system |
| :---: | :---: |
| 4 | PRrp |
| $\mathbf{3}$ | PRr |
| $\mathbf{3}$ | PRP |
| $\mathbf{2}$ | PR |
| $\mathbf{1}$ | P |

$$
\alpha=2.5, \beta=2, \gamma=\delta=1
$$

## Weights

2

- $\|X\|$ is the sum of weights of propositional functions:
$\|X\|=\alpha+\beta+l-2$ if $l=2,3,4 ;$
$\|X\|=\alpha$ if $l=1$
- Weights of $\Phi$ (same for $B$ ): If $(x, y) \in \Phi$, its weight is defined as $w(x) w(y)$.

## Weights of Word Classes

- For $y \in Y$, define $w(y)$ as the number of horizontally and vertically connected cells in the scheme

```
Head
Modifier
```

Predication

## Weights of Word Classes

- For instance, $w(\Lambda)=3$

|  | Head | Modifier |
| :--- | :---: | :---: |
| Predication | - | $\Lambda$ |
| Reference | $\Lambda$ | $\Lambda$ |

- $w\left(\mathrm{X}_{1}\right)=3$

- Flexibility of word classes is penalized.

## PoS System Types

- Rigid PoS systems ( $k=l, \mu=1$ ):

VNam, VNa $\emptyset, ~ V N \varnothing m, ~ V N \varnothing \emptyset, ~ V \emptyset \varnothing \varnothing ~$
(word classes are listed in the order which corresponds to the PRrp order of propositional functions they convey)

- Flexible PoS systems: $k<l$

## Flexible PoS System Types, $l=2,3$

| $l$ | $k$ | PoS system type | $\mu$ |
| :---: | :---: | :---: | :---: |
| 2 | 1 | ННФ $\quad$ | 5.500 |
| 3 | 2 | VA円 | 3.000 |
|  |  | 尹NØ ${ }^{\text {P }}$ | 3.333 |
|  |  | $\mathrm{VX}_{2} \varnothing \mathrm{X}_{2}$ | 3.250 |
|  |  | $\mathrm{X}_{1} \mathrm{NX}_{1} \varnothing$ | 3.625 |
|  |  | ННа $\varnothing / \mathrm{HH} \varnothing \mathrm{m}$ | 4.000 |
|  | 1 | $\mathrm{X}_{3} \mathrm{X}_{3} \mathrm{X}_{3} \varnothing / \mathrm{X}_{4} \mathrm{X}_{4} \varnothing \mathrm{X}_{4}$ | 6.500 |

## Flexible PoS System Types, $l=4$

| $l$ | $k$ | PoS system type | $\mu$ |
| :---: | :---: | :---: | :---: |
| 4 | 3 | VNMM | 2.000 |
|  |  | VAmm | 2.500 |
|  |  | FNaF | 2.750 |
|  |  | $\mathrm{VX}_{2} \mathrm{aX}_{2}$ | 2.800 |
|  |  | $\mathrm{X}_{1} \mathrm{NX}_{1} \mathrm{~m}$ | 3.100 |
|  |  | HHam | 3.250 |
|  | 2 | V $\wedge \wedge \wedge$ | 4.000 |
|  |  | ZNZZ | 4.375 |
|  |  | P/HHMM | 4.250 |
|  |  | $\mathrm{X}_{4} \mathrm{X}_{4} \mathrm{aX}_{4} / \mathrm{X}_{3} \mathrm{X}_{3} \mathrm{X}_{3} \mathrm{~m}$ | 5.125 |
|  |  | $\mathrm{X}_{1} \mathrm{X}_{2} \mathrm{X}_{1} \mathrm{X}_{2}$ | 4.250 |
|  | 1 | CCCC | 7.500 |

## Absolute Grammar Efficiency

$$
A E=Q \frac{\mid \text { Information } \mid}{\mid \text { Conveyors } \mid}=Q \frac{|X|}{|Y|}=Q \frac{l}{k}
$$

The coefficient of proportionality $Q$ depends on the complexity of the grammatical rules transforming the input $Y$ to the output $X$ :

- $Q$ depends on $\Phi$ and
- on word order or the permitted orders of propositional functions

## Previous Approach to Grammar

## Efficiency

- Parsing ratio:

$$
Q=Q_{o}:=\frac{s}{a}
$$

- $s$ is the number of unambiguous sentences (strings of word classes) permitted in the PoS system
- $a$ is the number of all parsing attempts of all permutations of each sentence in the PoS system (it is assumed that modifiers stand next to their heads)

## Turkish PoS System

- $l=4$
- $k=3$, word classes: $\mathrm{V}, \wedge, \mathrm{M}$
(more complicated than the basic types considered above $\mathrm{b} / \mathrm{c} \wedge$ and M overlap)
- Orders of propositional functions: RP, rRP, RpP, rRpP
- Sentences: $\wedge V, \Lambda \wedge V$ - ambiguous , M $\wedge V$, $\wedge M V$, $\wedge \wedge \wedge V, M \wedge \wedge V, ~ \wedge \wedge M V, M \wedge M V$

$$
s=7
$$

## Turkish PoS System

- Calculating $a$ is complicated:
$a=100$, after parsing 32 sentences

$$
A E_{o}=\frac{7}{100} \cdot \frac{4}{3}=\frac{7}{75}=0.0933
$$

- This is low because of the overlapping roles of $\Lambda$ and $M$ and because of the fixed order of propositional functions

## An Example of Parsing Attempts

- $\Lambda \Lambda V \rightarrow \operatorname{RrP}|\underline{R p P}| \underline{r R P \mid p-}$
- The approach of "regulated rewriting" is taken.
- Two possible interpretations (underlined) are left. This is why $\Lambda \wedge \mathrm{V}$ is an ambiguous sentence.
- Other permutations ( $\wedge \mathrm{V} \wedge$ and $\mathrm{V} \wedge \wedge$ ) are parsed in the same way...

## New Approach to Grammar Efficiency

The role of $a$ within the parsing ratio is dual:

- It is part of the measure of word-order flexibility/rigidity (all permutations of each possible sentence are considered)
- It also represents indirectly how far the relation $\Phi$ is from a bijection (all parsing attempts are considered)
The latter is not related to parsing and can be measured by $\mu$.

## The New Formula

$$
Q=Q_{n}:=\frac{q}{\mu}
$$

- $q=\frac{s}{m}$ - only measures the flexibility of word order, $m=\max \{\hat{s}, f(l)\}$
- $\hat{s}$ is the number of all possible sentences, unambiguous or not
- $f(l)$ is the maximum possible number of orders of propositional functions
- $f(4)=18, f(3)=6, f(2)=2, f(1)=1$

## Turkish PoS System

 3- $m=\max \{32,18\}=32$ (all 32 possible sentences have to be counted, but they do not have to be parsed)
- $q=\frac{7}{32}, \quad \mu=\frac{3 \beta+10}{6}+1=\frac{11}{3}$

$$
\begin{gathered}
A E_{n}=\frac{3}{11} \cdot \frac{7}{32} \cdot \frac{4}{3}=0.0795 \\
\text { (cf. } A E_{\mathrm{o}}=0.0933 \text { ) }
\end{gathered}
$$

## Relative Grammar Efficiency 1

$$
R E=R E(G)=\omega A E
$$

- $G$ is the grammar of a PoS system with $|X|=l$ and $|Y|=k$
- A maximally efficient grammar in this class has the greatest value of $A E$ and should satisfy certain properties (for instance, it should not permit ambiguity)
- If the maximally efficient grammar exists, its $R E$ is set equal to 1

## Relative Grammar Efficiency

2

- When the maximally efficient grammar exists and its $A E$ is $A E^{*}$, then $\omega=\frac{1}{A E^{*}}$. This results in

$$
R E=\frac{Q}{Q^{*}},
$$

where $Q^{*}$ is the greatest value of $Q$ for all grammars with $|X|=l$ and $|Y|=k$.

- Otherwise, set $\omega=1$ and $R E=A E$.

## Turkish PoS System: Old Approach

- Calculating $Q_{o}^{*}$ is also complicated: $Q_{o}^{*}=\frac{5}{8}$, after exploring all grammars with all 4 propositional functions and 3 word classes
- Values of $Q_{o}^{*}$ are calculated for all $k$ and $l$ in (Vulanović, 2008)
- Relative efficiency of the Turkish PoS system is

$$
R E_{o}=\frac{Q_{0}}{Q_{o}^{*}}=\frac{7}{100} \div \frac{5}{8}=\frac{14}{125}=0.112
$$

## Turkish PoS System: New Approach

- Calculating $Q_{n}^{*}$ is not so complicated: $Q_{n}^{*}=0.445$ (VNMM)

$$
\begin{gathered}
R E_{n}=\frac{Q_{n}}{Q_{n}^{*}}=\frac{3}{11} \cdot \frac{7}{32} \div 0.445=0.134 \\
\text { (cf. } R E_{o}=0.112 \text { ) }
\end{gathered}
$$

## Attested PoS System Types

- according to Hengeveld and van Lier (2010).
- This includes systems which are not attested in their "pure" form, but in combination with other types of systems.
- All 5 rigid systems ( $k=l, \mu=1$ ), VNam, VNa $\emptyset, ~ V N \varnothing m, ~ V N \varnothing \varnothing$, and $V \varnothing \varnothing \varnothing$, plus 8 flexible PoS systems
- The greatest values of $R E$ w.r.t. word order are calculated on the next slide.

## Greatest Values of $R E$ for Attested PoS System Types

| Type | $R E_{0}$ | $R E_{n}$ |
| :---: | :---: | :---: |
| CCCC | 0.286 | 0.015 |
| V $\wedge \wedge \wedge$ | 0.728 | 0.797 |
| Pan | 0.786 | 0.667 |
| VNMM | 0.914 | 1 |
| VAmm | 0.800 | 0.600 |
| V\#\# $\varnothing$ | 1 | 0.867 |
| $\mathrm{X}_{3} \mathrm{X}_{3} \mathrm{X}_{3} \varnothing$ | 1 | 1 |
| $Н Н \varnothing \varnothing ~$ | 1 | 1 |
| 5 Rigid Types | 1 | 1 |
| Coefficient of Correlation | 0.960 |  |

## Conclusions

- The new measure is much easier to calculate than the old one.
- The correlation of the old and new values for $R E$ is strong for the 13 attested PoS system types.
- It is somewhat weaker when all PoS system types are taken into account: $r=0.807$.
- Other PoS systems, which (like the Turkish PoS system) are more complicated than the basic ones, can now be approached more easily.

## Dziękuję bardzo!
